Constructing a threonine pathway model

- Kinetic models
- The threonine pathway
- Components of the modelling project
 - 1. Kinetic data
 - Example: aspartate kinase I
 - Product inhibition of AK I
 - 2. Generating Pathway Data
 - 3. Simulator (ScrumPy) Input
 - ScrumPy Input — 2
 - The Differential Equations
 - 4. Simulating Dynamics
 - 5. Extrapolating to *in Vivo* Behaviour
 - “External” Concentrations
 - Simulating Enzyme Over-Expression
 - Simulating Enzyme Over-Expression — 2
 - Simulated threonine accumulation
 - Further details

The Entner-Duodoroff Pathway

What controls the high glucose flux?

Model validation via response analysis

Constructing a threonine pathway model

- Further details

The Entner-Duodoroff Pathway

What controls the high glucose flux?

Model validation via response analysis

Needed:

a single **equation** for each enzyme containing all effects from

- substrates
- product inhibition
- reverse reaction
- effectors

Constructing a threonine pathway model

● Kinetic models

- The threonine pathway
- Components of the modelling project
- 1. Kinetic data

The Entner-Duodoroff Pathway

What controls the high glucose flux?

Model validation via response analysis

Needed:

a single **equation** for each enzyme containing all effects from

■ substrates

■ product inhibition

■ reverse reaction

■ effectors

using **parameters** determined at

■ *in vivo* pH

■ temperature

■ ion concentrations

in the organism, cell type and compartment under consideration.

The threonine pathway

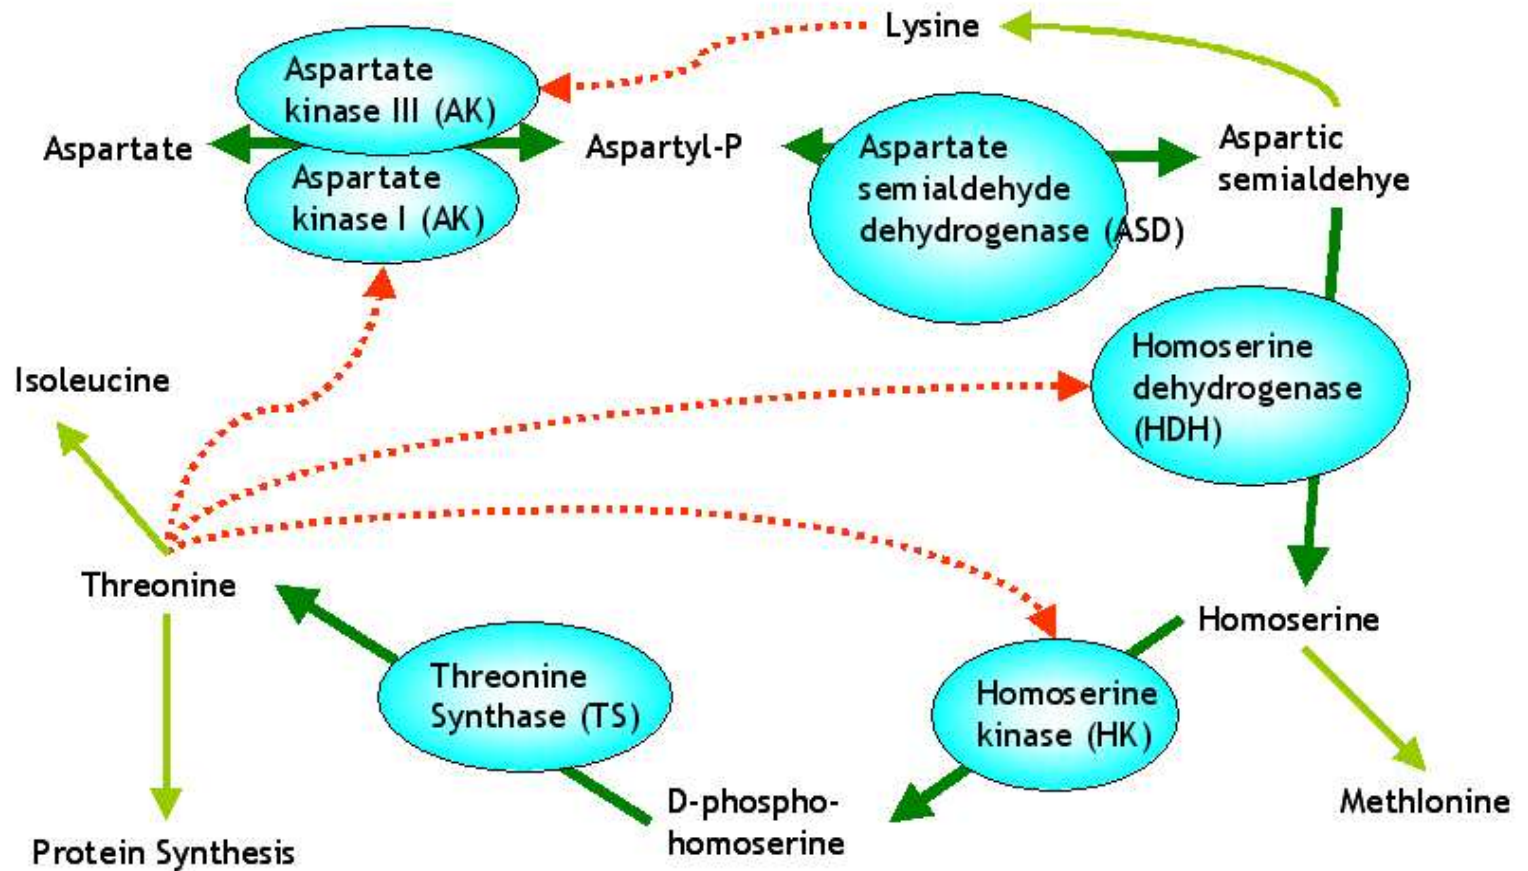

Constructing a threonine pathway model

- Kinetic models
- The threonine pathway
- Components of the modelling project
- 1. Kinetic data

What controls the high glucose flux?

Model validation via response analysis

Conclusions

- Has very high rates of glucose fermentation to ethanol and high tolerance to both.
- Uses Entner–Doudoroff (ED) pathway of glucose catabolism.
- Uncoupled growth phenomenon — whereby rates of catabolism exceed the requirements of anabolism. (98% glucose is converted to catabolic products.)
- Small genome size and reduced central metabolic network make it attractive for metabolic engineering.
- Electron transport chain poorly coupled to ATP synthesis could allow flexibility over redox state of engineered products.
- Good experimental data on kinetic properties of its ED enzymes, as well as metabolite measurements *in vivo* and in cell-free systems.

● Co-Response Coefficients

● Flux and Concentration Responses

● Validation with ATP:Flux Co-Response

Conclusions

... are ratios of the flux and concentration control coefficients to the same perturbation of enzyme activity.

For a small change in enzyme E affecting flux J and metabolite S , we don't need to know the exact size of the change in E :

$$\Omega_E^{S:J} = \frac{C_E^S}{C_E^J} = \frac{\partial \ln S}{\partial \ln J}$$

Constructing a threonine pathway model

The Entner-Duodoroff Pathway

What controls the high glucose flux?

Model validation via response analysis

● Co-Response Coefficients

● Flux and Concentration Responses

● Validation with ATP:Flux Co-Response

Conclusions

... are ratios of the flux and concentration control coefficients to the same perturbation of enzyme activity.

For a small change in enzyme E affecting flux J and metabolite S , we don't need to know the exact size of the change in E :

$$\Omega_E^{S:J} = \frac{C_E^S}{C_E^J} = \frac{\partial \ln S}{\partial \ln J}$$

From experimental literature, we may have a finite change response to a perturbation X , affecting one or more enzymes:

$$R_X^{S_i, J} = \frac{\Delta \ln S_i}{\Delta \ln J}$$

Constructing a threonine pathway model

The Entner-Duodoroff Pathway

What controls the high glucose flux?

Model validation via response analysis

- Co-Response Coefficients
- Flux and Concentration Responses
- Validation with ATP:Flux Co-Response

Conclusions

- The enzyme's flux control coefficient gives the % change in flux, J , for a 1% change in enzyme activity.
- An enzyme's concentration control coefficient gives the % change in metabolite S for a 1% change in enzyme.
- The enzyme's co-response coefficient gives the % change in metabolite S by an enzyme activity change causing a 1% change in flux J .

- Validation with ATP:Flux Co-Response

Conclusions

Constructing a threonine pathway model

The Entner-Duodoroff Pathway

What controls the high glucose flux?

Model validation via response analysis

Conclusions

● Summary

● Further Details

- A kinetic model of the native ED pathway has been built and shows that the high rates of glucose metabolism are linked to a high consumption of ATP.
- The model is consistent with failure to increase glycolytic flux by over-expression of glycolytic enzymes, and the functional coupling between glycolytic rate and ATP concentrations.
- It remains to apply this model to exploration of metabolic engineering towards the novel products.
